Where To Go From Here | Coursera

Congratulations!

You have finished the fourth course in this specialization. By this point, you know a lot about programming and Java, but this is not the end of your adventures, rather the start! So where can you go from here?

This Specialization's Capstone: We hope you'll be joining us in the capstone, where you will get to write your own recommender system. You'll have a chance to show off what you have learned in this large culminating project, putting together your Java programming, with website-making skills, and creativity to show the world what you can do!

UCSD's Course, "Develop Powerful Interactive Software": Our friends at UCSD have created an intermediate-level Java specialization on Coursera, which naturally follows this one. If you want to continue to develop your Java and programming skills, we recommend you check it out. They have some exciting projects, and wrap up with a bit about professional skills and interviewing, in case you are interested in becoming a professional programmer.

Delve Deeper Into The Particular Problems That Interest You: You can also build your skills by delving more deeply into the particular problem areas that interest you. If you found the DNA problems particularly exciting, you might be interested in a course on BioInformatics. If you really liked the cryptography lessons, you might want to take more courses on cryptography.
